

Customer Journey Map

Date	29 September 2026
Team ID	SWTID-2026-1374
Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value
Maximum Marks	2 Marks

Customer Journey Map

The customer journey of the administrator setting up and testing the Script-Controlled ACL, stage by stage: actions, touchpoints, thoughts, feelings, process ownership and improvement opportunities.

Phase of Journey	Stage 1: Setup	Stage 2: Configuration	Stage 3: Testing
Actions <i>What does the customer do?</i>	- Creates test users in ServiceNow - Creates roles bb1, bb2, bb3 and bb4 - Assigns roles to users	- Creates the Institution Details table - Adds records for ECE, EEE and CSE - Creates READ, CREATE, WRITE and DELETE ACLs	- Logs in / impersonates each test user - Tries to read, create, edit and delete records - Checks that admin sees all records
Touchpoint <i>What part of the service do they interact with?</i>	- Users module - Roles module - User record form	- Tables & Columns - Institution Details form and list - Access Control (ACL) module	- Impersonate User - Institution Details list view - Access denied message
Customer Thought <i>What is the customer thinking?</i>	- Which roles does each user need? - Each permission should have its own role - Roles must be assigned correctly	- Only authorized users should see EEE records - The READ ACL script must check the Branch value - Admin must keep full access	- Does each role get only its permission? - Are unauthorized users blocked? - Is the ACL working as expected?
Customer Feeling <i>What is the customer feeling?</i>	Curious and focused on getting the setup right	Careful and slightly worried about script mistakes	Confident and satisfied when access works correctly
Process Ownership <i>Who is in the lead on this?</i>	System Administrator	System Administrator / Developer	Administrator with test users

Opportunities <i>How can we improve this stage?</i>	• Use clear role names • Assign roles through groups • Document the role list	• Test the ACL script in small steps • Add comments in the script • Use update sets to track changes	• Prepare a test case for every role • Show a clear access denied message • Review ACLs regularly
