

Technology Stack

Date	29 September 2026
Team ID	SWTID-2026-1374
Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value
Maximum Marks	2 Marks

Define Your Technology Stack:

The technologies used to build the Script-Controlled ACL solution in ServiceNow, with a brief justification for each choice.

Technology Stack Details

S.No	Architecture Component / Layer	Technology Chosen	Justification / Purpose
1	Frontend / Client-Side	ServiceNow Platform UI (Forms & List views)	Built-in forms and lists are used to create and view Institution Details records, so no custom front-end is needed and ACL results can be seen directly.
2	Backend / Server-Side	ServiceNow server-side JavaScript (Script in ACL)	The READ ACL script checks the user's role and the Branch field value, so only authorized users can access EEE records.
3	Database / Data Storage	ServiceNow platform database (custom Institution Details table)	Stores student information for ECE, EEE and CSE branches with built-in security, roles and ACL support.
4	Cloud / Hosting / Deployment	ServiceNow Personal Developer Instance (PDI)	Free cloud-hosted instance for building and testing the roles, table and ACLs without any setup or hosting cost.
5	Version Control & CI/CD	ServiceNow Update Sets	Tracks changes to the table, roles and ACLs so the configuration can be reviewed and moved between instances.
6	Third-Party APIs / Other Tools	ServiceNow Users, Roles and Access Control (ACL) modules; Impersonate User	No external API is required. Built-in modules create test users and roles, and Impersonate User verifies the access of each role.
